Application

Sikla „Installation Guidelines“ is intended to provide guidance for supporting constructions within industrial pipework and plant engineering consisting of the Sikla Systems siFramo 80, siFramo 100, Beam System 100 and Beam System 120.

All CE marked systems are subject to the certified factory production control according to EN 1090 and may therefore be used to EXC 2 for load-bearing structures.

Basis of calculation

Eurocode 3 (DIN EN 1993) „Design of steel structures“ provides the basis for determining the load capacity. Regarding serviceability the specified restrictions are allocated separately according to the design of the individual constructions. These limits may also be specified differently by the client. All deformations are determined on the basis of characteristic loads ($\gamma_F = 1.0$). The values of the permissible loads comply simultaneously the ultimate limit state and the serviceability limit state design. The respective governing load is listed as $F_{z, perm}$ in the Installation Guideline.

Load effects

Specified are permissible vertical loads $F_{z, perm}$ in kN (e.g. pipeline weights), which have to be understood as maximum values of characteristic load effects and consider a safety factor $\gamma_F = 1.35$.

Some Sikla constructions take into account additional friction forces $F_x = F_z \cdot \mu_0$ for Sikla Pipe Shoes based on hot-dipped galvanized surface of Sikla beams which are calculated from pipe weight F_z and a friction coefficient $\mu_0 = 0.2$. These variable forces from pipe expansion are taken into account with a safety factor $\gamma_F = 1.5$. Sliding or guided Pipe Shoes (Sikla slide elements) with a higher coefficient $\mu_0 > 0.2$ (e.g. steel on steel) require an individual calculation.

Conditions

All loads are static loads at room temperature unless stated otherwise. Technical notes of the respective product data sheets for use and application range must be observed.

Load transmission into building structure

When fixing by anchors, or connection to existing cast-in channels, the structural safety analysis for the components used for this purpose must be done separately. When connecting to existing steel structures on site, resilience, support and torsional rigidity of the existing structure must be checked separately. In addition, when connecting with clamping sets, the static friction between clamping set and the on-site steel structure must fulfill the condition $\mu_0 \geq 0.2$ (Sliding Surfaces Class D). On-site steel structure sizes (flange widths) of ≥ 100 mm are considered by using clamps for connection points.

Unless shown otherwise: force direction F_x = steel structure longitudinal axis.

Connections to concrete are designed with anchor type VMZ-A M12 (ETA-10/0260) in concrete strength C20/C25 under the design specifications $h_{std} \geq 2 h_{ef}$ edge distance $c \geq 120$ mm. Axis distances are determined by the components.

Reduction factor $\alpha_A = 0.7$ for structural steel flange sizes ≥ 201 mm for End Support WBD F80, F100 and F100/160.

Technical Information

Installation conditions are summarized at the end of this brochure - in particular specifications regarding tightening torques, bolt spacing, general installation instructions etc.

Recyclebility of Products

Products must only be re-used if the recommended working loads have not been previously exceeded and if the coating has not been discernibly damaged.

General Remarks/ Disclaimer

This document is solely for being used by the receiver but remains property of Sikla. The technical drawings and all other content are to the best of our knowledge. Pictures and illustrations are non-committing. We can not be held responsible for printing errors and their implications. We reserve the right of making alterations and improvements without notice.

The present Guideline allows the user to select and to design supporting structures (constructions) easily. This document has been prepared in close cooperation with the following external specialists.

siFramo

Beam Section TP F 80 and TP F 100

Self-Forming-Screw FLS F

Thread- forming bolt with locking- serration for all connections.

Attention!

► Max. applied torque no more than 60 Nm !

Assembly of Beam Section TP F with WBD-End Support and End Support STA F

For best performance the Self-Forming-Screw FLS F must be applied to both sides in greatest possible distance apart 2 x 2 screws opposite one another.

Distance between end of section and end-plate: ≤ 10 mm.

Assembly to Beam Section TP F, e.g. Cantilever Bracket AK F

Offset hole-lines allow for connection at one level without collision of bolts inside the box section for all components with end-plate (e.g. STA F, SA F).

4 Self-Forming-Screws are required to fix each end-plate!

Each connection to the section requires 4 screws!
Plugged through the slotted hole, these will screw into the roand- hole of the section anderneath.

1100	3.25	2.02

F_z [kN] as a permanent load at distance L; F_x [kN] as a variable load at distance L.

2 Point Loads

L_{max}	$F_{z, perm}$ for	
	$F_x = 0$	$F_x = \mu_0 * F_z$
[mm]	[kN]	[kN]
300	7.94	4.93
500	4.77	2.96
700	3.40	2.11
900	2.65	1.64
1100	2.17	1.34

F_z [kN] as permanent loads at distance L and L/2; F_x [kN] as variable loads at distance L and L/2.

3 Point Loads

L_{max}	$F_{z, perm}$ for	
	$F_x = 0$	$F_x = \mu_0 * F_z$
[mm]	[kN/m]	[kN]
300	5.96	3.70
500	3.57	2.22
700	2.55	1.58
900	1.99	1.23
1100	1.62	1.01

F_z [kN] as permanent loads at distance L, 2*L/3 and L/3.

F_x [kN] as variable loads at distance L, 2*L/3 and L/3.

Friction coefficient $\mu_0 = 0.2$ for friction in longitudinal direction. Max. deviation L/100.

Working loads in accordance with Eurocode 3

Beam Bracket F 100 - Variante b) anchored

Part List
1 x Beam Bracket TP F 100
4 x Injection system VMZ-A (M12/125)

Distributed Load

L_{max}	$q_{z, perm}$	$F_z (q_{z, perm} * L)$

F_z [kN] as permanent loads at distance $3 \cdot L/4$, $L/2$ and $L/4$.

F_x [kN] as variable loads at distance $3 \cdot L/4$, $L/2$ and $L/4$.

All illustrated structures are able to be installed standing as well.

Friction coefficient $\mu_0 = 0.2$ for friction in longitudinal direction. Max. deviation $H/100$; $L/200$.

Working loads in accordance with Eurocode 3

Friction coefficient $\mu_0 = 0.2$ (for friction in longitudinal direction).

Supports (Pipe Shoes)

Supports (Pipe Shoes)

Application

The Sikla height- adjustable Supports (Pipe Shoes; HV 90, HV 150, HV 200) can be used as a Skid, a Guide or as a Fixed Point. The testing process of the individual Support types and the determination of the direction dependent permissible loads was carried out by the independent testing house TÜV Rheinland (Report No. 69617494/01).

Conformity

The Sikla Simotec Supports (Pipe Shoes) therefore fulfill DIN EN 13480-3 : 2012-11, where particularly in section 13.3.6.1 it is highlighted that the design of Pipe Support components is in accordance with DIN EN 1993.

For every Pipe Support type (incl. required connection kit) a declaration of conformity could be issued in accordance with ISO / IEC 17050.

Installation

Special bolts for height- adjustable connection of lower and upper Pipe Shoe components.
Tightening torque: 80 Nm

By combining **Pipe Shoe LA or LC** with the steel supporting structure and connecting parts below, it is possible to create a guided pipe shoe or a fixed point pipe shoe:

The dimension of the existing steel beam determines the required type of connection kit.
Can be installed on steel beams with flange width ≤ 300 mm and flange thickness ≤ 30 mm.

Notes on the following working load tables

The load values apply to pipe shoes from the HCP range as well as to the high temperature pipe shoes.
The load values are based on room temperature.

For higher temperatures, the corresponding temperature correction values according to the attached table must be taken into account.

Axial fixed point forces F_x can only be attained by the professional use of anti-slip protections (e.g. cleats, stoppers). Those have to be planned during the design of the piping and are on the responsibility of the piping manufacturer. To use our fixed point sets, fixed point angles and axial stops, it is necessary to dismantle the sliding plate, so a friction value of $\mu = 0.3$ should be taken into account for the pipe static consideration.

The tests for lifting forces - F_z were performed using a combination of a pipe shoe LA - HV and a guiding or fixed points sets. This results in the values for - F_z in the following combinations:

- beam connection with the **FS** guiding set or the **XS** fixed point set.
- cell Connection to siFramo with the guiding bracket **FW F** or the fixed point bracket **XW F**

Further statical product datas are available on request.

Design temperatures of pipe support components

The media temperature t_f has an influence on the system of the pipe support components. Acc. to DIN EN 13480-3 „all components of the pipe support have to be designed based on a range of temperature from 0°C to 80°C. If the operational temperatures of the piping system are outside of this range, the corresponding values have to be specified.“

During the design of pipe supports, components are basically assigned into 2 groups: inside and outside of insulation.

For all components being placed inside of an insulation the following values apply²:

Kind of component	Design temperature t of the pipe support (depending on the media temperature t_f)
Straps, pipe clamps and welded components with extensive contact to the piping system	$t = t_f$
Components not in contact with the piping system	$t = t_f - 20\text{ °C}$
Bolts, nuts, etc.	$t = t_f - 30\text{ °C}$

For all components being placed outside of the insulation the following values apply³:

Kind of component	Media temperature t_f	Design temperature t of the pipe support
Components in direct contact with the pipe	$t_f > 80\text{ °C}$	$t = \frac{1}{2} \times t_f$ (min. 80°C)
	$t_f \leq 80\text{ °C}$	$t = 80\text{ °C}$
Bolts, nuts, etc.	$t_f > 80\text{ °C}$	$t = \frac{1}{3} \times t_f$ (min. 80 °C)
	$t_f \leq 80\text{ °C}$	$t = 80\text{ °C}$

For clarification of the tables see the graphical illustration⁴:

¹ Compare EN 13480-3:2014-12, Table 13.3.1

⁴ Compare EN 13480-3:2014-12, Image 13.3.2-1

Correction values for pipe support components

The working loads of the SIKLA pipe shoes LA, LC and LD as well as for the rod hangers are valid for component temperatures up to 80°C. If components are getting warmer than 80 °C in service, the stated working loads have to be added with the correction value k to reduce the working loads. Because SIKLA pipe support components are manufactured with steel grade S235JR (or higher), the appropriate correction value has to be applied.

Correction val k depending on the temperature:

Correction values and practical application

$$F_{perm} \geq F_{exist}$$

$$(F_{perm} = F_{R,20^{\circ}C} * k) \geq F_{exist}$$

- F_{perm} permissible load of Sikla pipe shoe at temperature t_x [°C]
- F_{exist} pipe load according to structural analysis
- $F_{R,20^{\circ}C}$ permissible load of Sikla pipe shoe at 20 °C
- k correction value

Temperature t [°C]	Correction value k	
	16Mo3	S235JR
20	1.00	1.00
80	0.95	1.00
100	0.93	1.00
150	0.89	0.90

Working loads for Supports with insulation insert and suspension

Pipe Shoe LA / LC / LD - HV 200 + Guiding Set FS Z 80/120

Basis of assessment EC 3, working loads for Pipe Shoes as delivered.

Please note the information on page 46 about the working loads.
